Think Lambing

With March now here our thoughts are turning to lambing. Here at Synergy we stock a wide range of sundries, needles, syringes, lambing ropes and 10% iodine. **Don't be caught out with cheaper weaker substitutes**, they could leave navels open to infection. 500ml bottles are also now available with a spray top.

Also on offer are our lambing kits which remain at **last year's price, ideal to keep all your essentials** together in a sturdy box. Make sure you have your lube and Calciject no6 to hand for any complications.

| | |
|--|-----------------|
| Vet Lube 500mls | £2.50 |
| Syringes | £0.07— £0.15 |
| Hypodermic needles various sizes | £0.03— £0.15 |
| Arm-length Gloves Pk 50 | From £10.56 |

With the weather conditions being so wet and warm NADIS are forecasting a high fluke risk, please discuss diagnosis and treatment with your Vet or Animal Health Advisor.

Remember post lambing treatment of worms, leave your fat single ewes untreated so you have some non resistant worms on the pasture. Pasture management can help reduce the risk of nematodirus, please try to avoid any pasture grazed by lambs last year.

| | |
|------------------------|----------|
| Lambing Ropes | £3 to £4 |
| Iodine 10% 500mls | £7.10 |
| Iodine 10% 5 Litres | £45.15 |
| Lamb Feeder | £0.47 |
| Lambing Snare | £4.51 |

Dog wormers are also available for you keep up to date with your farm assurance scheme rules

Think Turnout

Although the idea of turning your cattle out may seem a long way off as this wet weather continues, once the ground dries up it is important to protect your cattle from parasites, particularly those in their first grazing season. For youngstock Autoworm boluses can be a simple option, requiring a single administration before turnout providing protection for 21 weeks through a pulse release system.

Autoworm First Grazer £15.80

Autoworm Finisher £14.20

Enovex 2.5 Litre

£36.00

Alternatively Enovex, an Ivermectin based pour on can be used, however treatment should be repeated throughout the season. Studies have recommended first season grazing calves are treated 3, 8 and 13 weeks post turn out in order to provide appropriate cover throughout the grazing season.

Please speak to your Vet or Animal Health Advisor in order to discuss your best option

Spotinor

2.5 Litre 195.00

1 Litre 85.00

Be prepared for flies this season

Get off to a FLYing start

Concerned about fly problems this year?

Hadn't really given it much thought yet?

Looking for a way to stop them before they start?

Did you know that we only see 20% of the problem, the other 80% are hidden as eggs, maggots and pupae. Traditional fly control is effective against the adult flies, but how do you stop the problem getting out of control?

One way is to treat the environment with products such as Neporex.

Neporex works by breaking the life cycle of the fly as it contains an Insect Growth Regulator (IGR) that disrupts the production of chitin, the building block of larval exoskeletons.

Up to 90% of the fly population on a dairy farm will develop in calf pens with straw bedding. Neporex can be applied

by spray at a rate of 500g per 5Lt water which will treat 20m² and is best repeated every 4-6 weeks.

Neporex is effective for the control of sucking flies, biting flies and mosquitoes.

It can be used as an effective control in Pig and Poultry units also.

**5kg - £100
20kg - £185**

Please contact Dispensary on 01935 83682 for more details.
